FLIGHTSYNC

Flight schedule intelligence

User manual

How to sign in, where the Database lives,
and what each profile is allowed to do.

Version 1.82

Team Leader · Scheduling · Team Calendar

Started by Athanasios Gkioles. Continued by Gino Guarnieri.
Educational use only. Authorship and distribution rights reserved.

1. What this app is

FlightSync is a single HTML page used by the instructor team to read the daily flight schedule (DFS), watch the balance of the day, and keep one shared calendar of shifts and absences. It runs in the browser. It does not need a server. The shared memory of the team is a JSON file that lives in the same folder as the HTML.

Open the file in Microsoft Edge or Google Chrome. Other browsers cannot choose a folder on the computer, and the Database will not load.

2. The three profiles

The first screen asks which door you are using. Choose the profile, then type the password. If you picked the wrong door, press **Back** and choose again. The version number is shown on that screen. Only the Team Leader can change the three passwords, from Dashboard.

Profile	Who it is for	What they can do
Team Leader	The person who approves the calendar and looks at the yearly numbers.	Every page. Approves or rejects requests. Locks a month. Sees STATS. Changes passwords.
Scheduling	The daily desk. Builds the week and checks the DFS.	Dashboard, DFS, Week Distro, day flags and currencies. A shift typed in Week Distro is saved at once. No STATS and no password changes.
Team Calendar	Each instructor, entering their own future days.	Only their own year. Requests a shift. Cancels a request. Prints their year. Cannot see DFS or STATS.

Passwords are not printed in this manual. Ask the Team Leader for the current one.

3. The app folder and the Database

Keep the HTML and every Database file in one folder. That folder may be a OneDrive or Teams folder that is synced to the computer. The browser cannot see a cloud drive by itself. It sees the folder you point at.

3.1 First time on a computer

If this browser has never been shown the folder, FlightSync asks for it before it looks for a Database. Choose the folder that already contains the HTML. It then loads the newest file whose name starts with `FlightSync_database_`.

Team Calendar users do this from the same login question, and later from **App folder** on the calendar. **Load newest** reads the folder again without changing it.

3.2 One file, and a new copy every save

There is no separate calendar file. Shifts, absences, DFS days, TMIS and settings are stored together. Every time someone presses **Save changes**, FlightSync writes a new file. The name carries the date, the time, the milliseconds and a short code, so two computers do not write the same name.

Older copies are kept. **Earlier versions**, at the top of the window, lists them. Open an older one if the newest file is damaged. That copy is used for this session only. The next time you sign in, the newest file is loaded again. If a file is bad, delete it from the folder so it stops being the newest.

3.3 Two people saving at the same time

The browser cannot lock a OneDrive folder. FlightSync does not overwrite the other person's file. Before it writes, it reads the newest file and adds the new change on top. If another file appears while it is saving, it reads again and writes once more, up to four times. Both copies remain. The later file is the one the team will open next.

Still, do not have two people editing the same instructor on the same day. Save, wait for the green confirmation, and let the other person press Load newest before they edit.

4. Team Calendar

This profile sees only the calendar. After the Database loads, choose one instructor. From then on you can type only on that name, and only on a date that is still in the future. The Team Leader is the only person who can change a day that has already passed.

4.1 What you can enter

Month	Codes you may request
Locked (closed padlock)	1ST, 2ND, NT
Open (open padlock)	1ST, 2ND, NT, and A, MED, Art28, 104, MIX, CPL, IML

Tap a future day and pick the code. The day is stored on the screen first. It is not shared until you press **Save changes**. A yellow line at the top says that you still have changes to save. Save writes a new Database file in the app folder.

4.2 Cancel, wait, and the answer

A request stays as a **red dot** until the Team Leader approves it. A **green dot** means it is approved and it is now the shift. If the Team Leader rejects it, the day goes back to empty and a warning mark explains that it was rejected. You can request that day again.

To withdraw a request that is still waiting, tap that future day and choose **Cancel request**, then Save changes. You cannot cancel a day that is already in the past.

4.3 What you can see, and the print

Sign out from the top bar when you leave the computer. The screen returns to the profile menu.

5. Scheduling

Scheduling is the working profile for the day. The left menu shows Dashboard, Personal, DFS check, DFS BALANCE, DFS pdf view, Week Distro, Day flags and Currencies. The STATS group is hidden. Passwords cannot be changed from this profile.

5.1 Dashboard

The home page. It lists the DFS files and the TMIS Excel files already in the Database, and it warns when a weekday is missing. Weekends are not expected. From here you also import a DFS, a TMIS file, or the Database, and you open the settings that the whole app uses: who is monitored, who is a FLY IP or a SIM IP, lunch and dinner windows, duty length, and the Teams folder.

Settings lists are closed when you arrive. Open only the one you need. Hidden instructors stay in the list so they can be turned back on later. ACS balancing uses only the instructors you have already selected.

5.2 DFS check

The day view. The timeline is in UTC. Each instructor row shows the name, the shift (1ST, 2ND, NT, or LIC and the other absence codes), the number of events, and warnings at the end of the row.

5.3 DFS BALANCE and DFS pdf view

DFS BALANCE lists FLY IPs and SIM IPs apart. For each person it shows events per day present, student flights, support, student sims, support sims, STRIVE and lessons. The busiest 30 percent is red. The quietest 30 percent is yellow. It is not a workload planner. It is a picture of who is carrying the day.

DFS pdf view is only a viewer. It does not store the PDF inside the HTML. Choose a file, then use the same zoom and search you would have in Edge or Chrome. The file stays on screen until you open another one.

5.4 Week Distro

Week Distro reads the Team Calendar. It does not import a monthly PDF. Empty days stay empty. Tap a code to change it. A change made here by Scheduling is written onto the calendar at once. It does not wait for the Team Leader. Type a note beside the shift. Tick a cell if that change should print in yellow.

The printed Week Distro uses the same colours as the screen. FLY IPs and SIM IPs are separated by a blank row. The instructor's name takes the colour of the shift. A changed shift and its note print on yellow. The bottom of the page counts 1ST, 2ND and NT for FLY and for SIM, for each day. Before printing, the app asks which change number this is. Change 0 is the base. From change 1 onward, differences from change 0 are yellow.

5.5 Day flags and Currencies

Day flags mark Night, Range, Holiday and No fly. A Holiday or a No fly day is not reported as a missing DFS or a missing TMIS file. Night days are used by Currencies and show a crescent on the calendar.

Currencies takes the Excel export and, for the instructors already selected, shows the days left on CAS, NIT and AAR, plus the medical check expiry. The calendar under the table shows those expiry dates and a 30-day warning. Night weeks marked on the calendar sit on the same month so you can see if a currency falls inside a night week.

6. Team Leader

The Team Leader sees every Scheduling page, plus the STATS group, the approval list, the month locks and the calendar log. This is the only profile that can change a past date, change passwords, and lock a month.

6.1 Approving the calendar

Open Team Calendar. Requests that are still waiting are listed at the top. Approve or reject each one. Reject clears the day and leaves a warning so the instructor knows, and can ask again. A red dot is waiting. A green dot is approved. Scheduling changes made in Week Distro do not appear in this queue. They are already effective.

A closed padlock on a month means Team Calendar users may request only 1ST, 2ND or NT. An open padlock also allows the absence codes. The lock is visible on the instructor's own calendar.

Filter the team grid by FLY or SIM. Each day shows the count of 1ST, 2ND and NT, and the presence of that group. Presence uses weekdays only, and it removes holidays and the absence codes. Under 80 percent the percentage is red.

At the bottom of the team calendar, the **Calendar log** records who asked for which shift, on which day, and whether it was requested, approved, rejected, cancelled or set by Scheduling or the Team Leader.

6.2 STATS

These pages are hidden from Scheduling and from Team Calendar.

Page	What it answers
DFS STATS	Shifts taken from the DFS already imported: 1ST, 2ND, NT, days present, average sign-in and sign-out, free hours inside the duty window, and how often each instructor flew or simmed in each GO. Choose a month or the year.
Per IP	One instructor across the year: monthly totals and the list of events.
TMIS STATS	Presence against the target. The FLY target starts at 201 and the SIM target at 205. You can change both.
Flight Hrs	Hours taken from the Duration column of the TMIS Excel, not from the DFS PDF. One Excel per day: a second file for the same day replaces the first. Numbers more than 30 percent above the average are red. Numbers more than 30 percent below are yellow. The buffer can be changed.
Reports (TMIS)	A monthly table. FLY IPs: student flights, support missions (the name starts with SUPP), flight hours, cancelled flights, student sims and support sims, plus STRIVE, RTMS and lessons taken from the DFS. SIM IPs: sims and support. Filter inside FLY or SIM to get a subtotal and an average. Print one month, several months, or the year. The busiest 30 percent in a column is red. The quietest 30 percent is yellow.

Import TMIS from Reports or from the Dashboard. The same Excel also feeds Flight Hrs. Currencies uses its own Excel, the table export with the expiry columns.

6.3 Passwords and auto-lock

In Dashboard, Security, the Team Leader types the current Team Leader password and then any new password. Leave a pair blank to keep that profile as it is. A new password must be at least four characters. The Team Leader password itself can be changed. Scheduling and Team Calendar cannot open this box.

Auto-lock is a number of idle minutes. After that, the app asks for the profile and the password again. Zero means it locks only when the browser tab is closed. **Lock now** does it at once. **Sign out** returns to the profile menu.

7. Colours and marks

Mark	Meaning
Blue cell	1ST
Amber cell	2ND
Purple cell	NT, night shift
Red-tinted cell	Absence: A, MED, Art28, 104, MIX, CPL, IML
Crescent	The day is marked Night
Red dot	Request waiting for the Team Leader
Green dot	Request approved
Warning mark	The Team Leader rejected this day. It is clear and can be requested again.
Yellow on the Distro	A change since change 0, or a cell you ticked
Red name on the timeline	Less than 12 hours since the previous duty
Red / yellow numbers	Well above the average, or well below it

8. A normal day

9. When something looks wrong

What you see	What to do
No Database at login	Press App folder, or the login prompt, and choose the folder that contains the HTML. Then Load newest.
Update failed	The folder permission expired. Choose the folder again. Use Edge or Chrome, not a preview pane.
My request disappeared	Someone saved a newer file. Press Load newest. If it is still missing, open Earlier versions and look at the previous copy.
Two different pictures on two computers	Both people must Load newest. The later file is the one that counts. Do not keep editing an old copy.
A bad file is the newest	Open Earlier versions and load a good copy for this session. Then delete the bad file from the folder, so the next login does not pick it up again.
Print does nothing	Allow pop-ups for this page, then press Print year or the Distro print again.
The PDF viewer is blank	Press Open PDF and pick the file again. The viewer only displays it. It does not store it.

This manual describes FlightSync 1.82. The app shows its version on the sign-in screen and in the top bar. If the number on your screen is higher, a later manual may exist.

FlightSync was started by Athanasios Gkioles and is continued by Gino Guarnieri for educational use. Authorship and the right to distribute the application are reserved.
